ABSTRACT

There is a flood of modern machines in the world, whose form has been taken by AI, it is entering the life of every person, whether it is your TV or fridge, it is visible in every field, from automobile to mobiles phone. Everyone has become accustomed to AI. The special thing is that in this era of modernity, the help of AI is being taken to increase the yield of agriculture. Farmers are able to spray their crops through drones. So in the same world, AI is also being used in large quantities in the fields of war like drone missile, guided missile, satellite missile etc. This AI is moving towards the new future of the world by which either peace will be established in the future or a devastating war will be fought.

Although AI is likely to be operated by humans only because if this does not happen then the future of the world will be in the hands of AI.

But given the various AI stages, this can only be imagined The Russia-Ukraine war is now at a more disastrous stage, in such a situation, what role AI can play in the search for peace remains to be seen. Due to differences with you and hunger for expansion, today the world is once again at a disastrous stage, among them China - Taiwan, Isreal-Iran etc. countries are standing on the front-line regarding the war against each other. Which cannot be seen normally. The related research paper attracts more attention to this and also questions the utility of AI. Although it will prove useful in some areas, can Ai be used for peace instead of war? it remains to be known

Keywords: *Airtificial Intelligence, AI In Automobiles, China-Taiwan, Isreal-Iran, Russia-Ukraine War*

Preface

The changing conditions of the world have made it clear that in the coming times the world can be divided into two axes, here war can be the only way through which new powers will emerge. The war condition of Russia and Ukraine proves this fact. The world is declaring

as well as China's campaign against Taiwan, Israel-Palestinian dispute etc. seems to be inviting the third world war. Russia has a stock of various weapons, Russia itself as a world power If it is stable, then America and NATO countries are gathering to help Ukraine. In the midst of all this, China's maneuver against

Taiwan is being pushed towards a devastating war tomorrow, which can be fatal for the whole world.

But will this war be fought only and only on the ground or its alternative has been found. The consumption of weapons can be increased and human loss can be reduced to zero. The future war depends on the success of AI, it is a human-like structure which has been shaped by humans in such a way that it follows those orders in the same way. The orders which will be given to them by humans, then we should assume that the coming future will be of AI? I believe that the coming future will lead to a revolution and this revolution will be known as artificial intelligence. Where another unmanned communication system will emerge, as well as the movement of human-powered vehicles will increase. In this episode, Japan, Countries like America, South Korea, China etc. are standing in the field with their equipment, India is included in the list of countries for which nothing is impossible. Because of this, when India will explode in the form of AI technology, it will be known only in the future. However, on many occasions indigenous parts made in India in the form of high-tech technology prove that India is becoming self-dependent with new advance technology and in the coming times, India is a leader in AI.

AI in Japan

Japan is one of the leading countries in the technical chain, Japan is currently moving forward to modernize all its goods in the modern era, in this series Japan has emphasized the utility of AI and various types of research Japan is moving forward on how to advance AI for human benefit by Japan. Recently, Japan has considered its AI as one of the successful efforts where all the employees are AI / robots in Hennah Hotel in Tokyo Also The help of AI is being taken to provide the facility from hotel registration to check-in. The special thing is that now it has become a center of attraction for everyone because it is the first AI hotel in the world where unmanned work is being done, being done by AI

Looking at the future, Japan is doing other types of research in this area so that unmanned

facilities can be increased from automobile to hotel sectors.

Efforts are being made in India in this direction, how to make robot style useful with humans, but it may take time for India to work in this direction, although Tata, Reliance, Mahindra etc. Has started using AI in the vehicle chain, due to which AI will become the need of India in future and further progress will also be seen in various fields.

Artificial Intelligence in Future War

At present Russia-Ukraine war is at its peak, it is inappropriate to say what will be its future, but this war future is attracting more attention for AI experiments. Ukraine seems to be collapsing on the base. Russia is using guided missiles to attack areas that are miles away. All this has been possible only because of AI. Russia is defending its country on its own strength. If Ukraine is committed to NATO, then the related weapons that Ukraine is getting from NATO countries are proving to be insufficient. Action has been taken by Ukraine to attack Moscow by drone missile, due to which Russia is more aggressive. It is happening, due to which there is a possibility of Russia fighting the upcoming war with unmanned weapons only. will only have disastrous results.

China's strategy

China is also not untouched by this war. China is watching this war very seriously. Its first effort is to include Taiwan in China as soon as possible and make the dream of one China come true. For which China has also started using AI, for which AI Central Command Center has also been established by it, through which China is monitoring Taiwan through radar, wireless communication channel, even through satellite. China is also keeping an eye on the related areas of Taiwan so that China can attack Taiwan through water, land and sky as soon as it gets a chance. China also took action to ambush Taiwan through cyber attack can go

America is keeping a close eye on China regarding the plan to occupy Taiwan, America has been saying that any kind of war on Taiwan will not be tolerated, due to which China has to retaliate, America's House Speaker Mrs. Nancy

Pelosi and Other MPs reached Taiwan to meet the President of Taiwan. It is also becoming a matter of concern for China because China cannot attack America directly, if this happens then a new war may start, which will be directly between America and China.

Artificial Intelligence can be used directly in this war because unmanned technology has been made for these wars only and only one button to operate various nuclear weapons / atom bomb / guided missile / drone etc. There is only a need to suppress which can be run through satellite. Through these new technologies, success will be achieved in winning the war and the task of penetrating the concerned area will also be done. Soldiers will not have to be lost in war zones.

Conclusion

Today the world has stepped into the new technological era, on one side is Elon Musk's Tesla and on the other is India's Reliance, Tata and other companies. All of them are eager to introduce the world to new technology. perhaps that day is far away when the language of books will be focused on the hands and the need of a doctor for training of diseases will be negligible because all the work will be edited by AI. But it is not possible to say how successful the AI era will be. But through AI, the editing of unmanned tasks will be done with great speed.

At the time of war, due to the use of these innovative techniques, the loss of soldiers can be prevented, as well as the war can be fought without going to the war zone. But to use such advance technology, everyone has to be efficient in the same amount AI can be used in a higher way. Along with this, there will be a need to strengthen backup power management and anti-hacking system to prevent the increasing internet hacking system, so that AI can be used easily during war and emergency.

Can we all be addicted to AI in the future, where every work of ours will be done by a robot, maybe yes. Its beginning has started in Japan, China etc., but looking at the future, its utility in India and other countries There is a contradiction to bring into practice. Many countries believe that with the arrival of AI, humans will become thoughtless, and lazy because they will depend on AI for every task, then what is the purpose of such technology, due to which unemployment will increase in the whole world.

And work will be done by robot in place of human. World war is on the way. Russia-Ukraine, China-Taiwan, Isreal-Iran and Palestine etc. have started undeclared war. And in these war all countries are fighting AI war We are using technology. Who will win or who will lose in the war cannot be predicted, yet there is still a ray of peace left.

There is also the belief that when AI technology can be used in war, can AI be used for future peace as well?

A small effort towards world peace
